

I claim:

1. A modular support apparatus comprising:

- (i) a first support frame;
- (ii) a second support frame; and
- 5 (iii) a linking member;

wherein each support frame has a lower region, an upper region, and at least one engagement means proximate the upper region thereof, wherein said linking member has a first end and a second end for engagement with the engagement means of the respective support frame, and whereby each end of the linking member is removable from the engagement means of the respective support frame.
